FUNCTION: Binds the lower part of the 30S subunit head. Binds mRNA
in the 70S ribosome, positioning it for translation (By
                                                                                                                                  -!- SUBUNIT: Part of the 30S ribosomal subunit. Forms a tight complex with proteins S10 and S14 (By similarity).
-!- SIMILARITY: Belongs to the S3P family of ribosomal proteins.
-!- SIMILARITY: Contains 1 KH type-2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

C. -I. CATALYTIY: D-glyceraldehyde 3-phosphate + phosphate +
NAD(P) (+) = 3-phospho-D-glycerayl phosphate + NAD(P) H.
C. -I. PATHWAY: Second phase of glycolysis; first step.
C. -I. SUBUMIT: Homoterramer (By similarity).
C. -I. SUBUMIT: Belongs to the glyceraldehyde 3-phosphate
dehydrogenase family.

Bacteriol. 185:2330-2337(2003).
-!- FUNCTION: Responsible for synthesis of pseudouridine from uracil-13 in transfer RNAs (By similarity).
-!- CATALYTIC ACTIVITY: Uracil + D-ribose 5-phosphate = pseudouridine 5'-phosphate + H(2)O.
-!- SIMILARITY: Belongs to the pseudouridine synthase trub family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             10-OCT-2003 (Rel. 42, Created)

                                                                                                                                        Nature 413:852-856(2001).

-!- FUNCTION: Responsible for synthesis of pseudouridine from uracil-13 in transfer RNAs (By similarity).

-!- CATALYTIC ACTIVITY: Uracil + D-ribose 5-phosphate = pseudouridine 5-phosphate + H(2)0.

-!- SIMILARITY: Belongs to the pseudouridine synthase trub family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Delius H., Hebling U., Hofmann B.;

Submitted (JUL-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Most upstream protease of the activation cascade of
caspases responsible for the TWRFSF6/FAS mediated and TWRFSF1A
induced cell death. Binding to the adapter molecule FADD recruits
it to either receptor. The resulting aggregate called death-
inducing signaling complex (DISC) performs CASPB proteolytic

DISC and free to activate downstream apoptotic proteases.
CAPS and CAPS, are likely retained in the DISC. Cleaves and activates CASP3, CASP4, CASP6, CASP7, CASP9 and CASP10. May activates CASP3, CASP4, CASP6, CASP7, CASP9 and CASP10. May participate in the GZMB apoptotic pathways. Cleaves ADRR.
CINCARD FAIGHT CONDOX VITUS CRMA death inhibitory protein.
CINCARD FAIGHT INHIBITED by Z-VAD-FK, Crma and P35.
CI-ENTYME REGULATION: Inhibited by Z-VAD-FK, Crma and P36.
CI-TISSUB SPECIFICITY: Expressed in a wide variety of tissues.
CI-TISSUB SPECIFICITY: Expressed in a wide variety of tissues.
CI-MIGHEST CASPESSION in Spleen, thymus, liver and kidney.
CI-COMER EXPRESSION in heart, brain, testis and skeletal muscle.
CI-COMER EXPRESSION in the embryo, highest expression occurs at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright.   The active dimeric enzyme is then liberated from the
                                                                                                                                                                                                                                                                                                                 -!- PTM: Generation of the subunits requires association with the death-inducing signaling complex (DISC), whereas additional processing is likely due to the autocatalytic activity of the activated procease. GZMB and CASP10 can be involved in these processing events (By similarity).
-:- SIMILARITY: Belongs to peptidase family C14.
-:- SIMILARITY: Contains 2 death effector (DED) domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Apoptosis; Zymogen; Repeat.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PUNCTION: Member of the two-component regulatory system phoQ/phoP which regulates the expression of genes involved in virulence and promotes intramacrophage survival of S.typhimurium. Is required to attenuate bacterial growth within fibroblast cells. PhoQ may function as a membrane-associated protein kinase that phosphorylates phoP in response to environmental signals.

SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   STRAIN-LTZ / SGSC1412 / ATCC 700720;

                                                  ISOId=Q8BN21-4; Sequence=VSP_008539, VSP_008540;
Note=No experimental confirmation available;
-! TISSUE SPECIFICITY: Expressed in liver, kidney and muscle. Weakly expressed in thymus, bone marrow and spleen.
-! DEVELOPMENTAL STAGE: Weakly expressed in embryo compared to VRK1 and VRK3. Expressed from E10.5 to E14 in developing liver and then decreases. It increases again from E17.5 and remains thereafter. Highly expressed in hematopoietic embryonic tissues from E10.5 to E14.5. Weakly expressed in the yolk-sac.
-! SIMILARITY: Belongs to the Ser/Thr family of protein kinases. VRK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Does not bind bind ubiquitin polymers.

Uniquitin polymers.

(proteasome) and a regulatory ATPase complex. Both are multisubunit structures that associate in the presence of ATP to multisubunit structures that associate in the presence of ATP to form the protease. Subunit 55B is part of the regulatory complex. DOMAIN: Rich in dileucine repeats, which have been implicated in
                                                                                                                                                                                                                                                                                                                                Deveraux Q., Jensen C., Rechsteiner M.; "Molecular cloning and expression of a 26 S protease subunit enriched
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDILNE=96051339; PubMed=7584044;

Isold=Q86Y07-5; Sequence=VSP_008535, VSP_008536;
Note=No experimental confirmation available;
-!- TISSUE SPECIFICITY: Widely expressed. Highly expressed in fetal
liver, skeletal muscle, pancreas, heart, peripheral blood
Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-! FUNCTION: Probable serine/threonine kinase (By similarity).
-!- CATALATIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
-!- SUBCELLULAR LOCATION: Type IV membrane protein (Potential).
-!- ALTERNATIVE PRODUCTS:
Event_Alternative splicing; Named isoforms=5;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ANCHOR FOR TYPE IV MEMBRANE PROTEIN

                                                                                                            SUBUNIT: Homodimer.
INDUCTION: By interferon.
PTM: Autophosphorylated on several Ser and Thr residues.
Autophosphorylation of Thr-451 is dependent on Thr-446 and is stimulated by dsRNA binding and dimerization.
SIMILARITY: Belongs to the Ser/Thr family of protein kinases. GCN2
EMBO J. 17:5458-5465(1998).

-!- FUNCTION: On activation by double-stranded RNA in the presence of ATP, the kinase becomes autophosphorylated and cartalyze the phosphorylation of the alpha subunit of BIF2, which leads to an inhibition of the initiation of protein synthesis.
-!- ENEXYME REGULATION: Activity is markedly simulated by manganese ions. Besides dsRNA, heparin is a potent activator of the kinase. Binding to dsRNA is required for dimerization leading to autophorylation in the activation loop and stimulation of
                                                                                                                                                                                          SIMILARITY: Contains 2 DRBM (double-stranded RNA-binding) domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PROTEIN KINASE.

-!- FUNCTION: PROBABLE RECEPTOR. MAY MEDIATE INTRAELLULAR SIGNALING.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: WIDE TISSUE DISTRIBUTION (HIGHEST IN THE PANCREAS AND VERY LOW IN BRAIN). CLOSELY ASSOCIATED WITH THE BASAL LAYER OF CELLS IN EPITHELIA AND THE ENDOTHELIUM OF BLOOD VESSEL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DEVELOPMENTAL STAGE: Is under developmental control in liver and may also be regulated during differentiation in other tissues. Upregulated following malignant transformation in some cell types. POLYMORPHISM: LU is responsible for the Lutheran blood group

-!- PATHWAY: Biosynthesis of auxins from tryptophan; first step.
-!- MISCELLANBOUS: THE SEQUENCE SHOWN IS THAT OF ACHS.
-!- SIMILARITY: SIGNIFICANT HOMOLOGY TO THE ADENINE BINDING REGION OF P-MYDROXYBENZOATE HYDROXYLASE FROM P. FLUORESCENS. IT SEEMS THAT THIS PROTEIN BINDS ADENINE EITHER AS SUBSTRATE OR COFACTOR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     STRAIN=Ach5; PLASMID=priAch5;

Submitted (MAR-2001) to the EMBL/GenBank/DDBJ databases.
-: FUNCTION: Through the carboxylation of phosphoenolpyruvate (PEP)
it forms oxaloacetate, a four-carbon dicarboxylic acid source for the tricarboxylic acid cycle.
-:-CATALYTIC ACTIVITY: Phosphate + oxaloacetate = H(2)O +
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 s.
